## **Abstract of the Disclosure**

A thin, lightweight retention mechanism with a spring force holds an integrated circuit package to a circuit board. The retention mechanism consists of a pressure plate, a backing plate, and a fastening means for applying a deforming force to the plates, such as screws and nuts. The plates are paraboloid or dish-shaped and made of an elastically deformable material, such as steel. The fastening means simultaneously applies deforming forces to the peripheries of the plates to

create a continuous spring force to effect electrical continuity between the integrated

circuit package and the circuit board. In addition, a method of testing the retention 10 mechanism and a method of assembling the retention mechanism are disclosed.
